Abstract

Purpose – The purpose of this paper is to perform a systematic review of articles that have used the unified theory of acceptance and use of technology (UTAUT).

Design/methodology/approach: The results produced in this research are based on the literature analysis of 174 existing articles on the UTAUT model. This has been performed by collecting data including demographic details, methodological details, limitations, and significance of relationships between the constructs from the available articles based on the UTAUT.

Findings: The findings were categorised by dividing the articles that used the UTAUT model into types of information systems used, research approach and methods employed, and tools and techniques implemented to analyse results. We also perform the weight analysis of variables and found that *performance expectancy* and *behavioural intention* qualified for the best predictor category. The research also analysed and presented the limitations of existing studies.

Research limitations/implications: The search activities were centered on occurrences of keywords to avoid tracing a large number of publications where these keywords might have been used as casual words in the main text. However, we acknowledge that there may be a number of studies, which lack keywords in the title, but still focus upon UTAUT in some form.

Originality/value: This is the first research of its type, which has extensively examined the literature on the UTAUT and provided the researchers with the accumulative knowledge about the model.

Keywords: UTAUT, Systematic review, Weight analysis, External variables, Demographic details, Methodological analysis

Paper type Research paper

1. Introduction

The continuing quest to ensure user acceptance of technology is an ongoing management challenge (Schwarz and Chin, 2007), and one that has occupied IS/IT researchers to such an extent that technology adoption and diffusion research is now considered to be among the more mature areas of exploration (Venkatesh *et al.*, 2003). This substantial level of activity has witnessed the use of a wide range of exploratory techniques examining many different systems and technologies in countless different contexts, to the extent that even the most cursory examination of the extant body of literature will reveal a variety of stakeholder perspectives, technologies and contexts, units of analysis, theories, and research methods (Williams *et al.*, 2009). This situation has in turn led to an element of confusion among researchers, as they are often forced to *pick and choose* characteristics across a wide variety of often competing models and theories. In response to this confusion, and in order to harmonize the literature associated with acceptance of new technology, Venkatesh *et al.* (2003) developed a unified model that brings together alternative views on user and innovation acceptance – The Unified Theory of Acceptance and Use of Technology (UTAUT).

The UTAUT (Figure 1) suggests that four core constructs (performance expectancy, effort expectancy, social influence and facilitating conditions) are direct determinants of behavioural intention and ultimately behaviour, and that these constructs are in turn moderated by gender, age, experience, and voluntariness of use (Venkatesh *et al.*, 2003). It is argued that by examining the presence of each of these constructs in a ‘real world’ environment, researchers and practitioners will be able to assess an individual’s intention to use a specific system, thus allowing for the identification of the key influences on acceptance in any given context. The theory was developed through the review and integration of eight dominant theories and models, *viz*: the Theory of Reasoned Action (TRA), the Technology Acceptance Model (TAM), the Motivational Model (MM), the Theory of Planned Behaviour (TPB), a combined Theory of Planned Behaviour/Technology Acceptance Model (C-TPB-TAM), the Model of PC Utilization (MPCU), Innovation Diffusion Theory (IDT), and Social Cognitive Theory (SCT). These contributing theories and models have all been widely and successfully utilised by a large number of previous studies of technology or innovation adoption and diffusion within a range of disciplines including information systems, marketing, social psychology, and management. In their original article, Venkatesh *et al.* (2003) presented results from a six-month study of four organisations, which revealed that the eight contributing models explained between 17 and 53 percent of variance in user intentions to use IT. However, UTAUT was found to outperform the eight individual models with an adjusted R^2 of 69% (Venkatesh *et al.*, 2003).

Fig. 1. Unified Theory of Acceptance and Use of Technology (Source: Venkatesh *et al.*, 2003)

In the years since its introduction, UTAUT has been widely employed in technology adoption and diffusion research as a theoretical lens by researchers conducting empirical studies of user intention and behaviour. At the time of writing, the original article Venkatesh *et al.* (2003) has been cited just under 5000 times, with UTAUT being discussed with reference to a range of technologies (including the Internet, Web sites, Hospital Information Systems, Tax Payment Systems and Mobile Technology among others) with different control factors (such as age, gender, experience, voluntariness to use, income, and education), and focusing upon a variety of user groups (for instance, students, professionals, and general users).

However, despite this evident impact, no study to date has either surveyed or reviewed the performance of UTAUT, or explored/assessed the findings, limitations, and potential future directions. In keeping with other review work such as that of Lee *et al.* (2003), such a study is likely to be of value in that it can assist researchers of acceptance and use understand prior UTAUT-related findings, recognize possible future research topics, and guide future research endeavours. The aim of this study therefore is to provide such a review.

The remainder of this paper is structured as follows: In the following section we describe the methodology employed, and follow this with a section presenting our findings based upon an analysis of the material along a series of dimensions - including demographic aspects, types of technology examined, methodological considerations, and an analysis of UTAUT and external constructs employed in various studies. We present a summary of the limitations of extant UTAUT studies, and finally we present our concluding remarks and suggestions for future research directions.

2. Research Methodology

This study examines UTAUT research conducted from 2004 to June 2011. A comprehensive electronic search using *ISI Web of Knowledge* and *Google Scholar* resulted in 174 usable research papers. We used the keywords such as “unified theory of acceptance and use of technology” or “UTAUT” to perform the overall search in the title and/or abstract of the articles. The studies, although being scattered across 134 journals and conferences, appeared more frequently in journals such as *Computers in Human Behaviour*, *Computers & Education*, *Communications of the Association for Information Systems*, *Decision Support Systems*, *Expert Systems with Applications*, *Government Information Quarterly*, *Information & Management*, *International Journal of Electronic Government Research*, and *MIS Quarterly*. Conference proceedings regularly including UTAUT material included the *Americas Conference of Information Systems*, the *European Conference of Information Systems*, the *Hawaii International Conference on System Sciences*, and the *Southern Association for Information Systems Conference*. The keywords associated with these 174 articles were noted, and in keeping with the works of Lee *et al.* (2003) and Legris *et al.*

(2003) in their comparable studies works examining the use of TAM, the articles were analysed in terms of a series of characteristics including types of relationships found between model constructs, external variables, limitations of studies, and methodological details.

3. Research Findings

Many different researchers with different research intentions and subjects of focus have conducted UTAUT studies by applying a variety of research methodologies in different environments. This diverse body of work has seen numerous new constructs being incorporated into the original theory, with UTAUT being blended with other theoretical models, and on occasion, a re-specification of the underlying relationships between UTAUT variables. These research papers were published in journals and conferences in diverse streams of study, and in line with the findings of Lee *et al.* (2003) in their study of TAM, were seen to have drawn the attention of both researchers and practitioners. This section presents an analysis of these UTAUT studies by examining a number of variables including most productive authors, universities/institutions and authors, most productive departments, university affiliation according to country, sources of primary data by country, authors' academic backgrounds, publications frequency, number of authors, publication outlets for UTAUT researchers, keyword analysis, types of systems examined, research subjects, relationships between major UTAUT variables, weight analysis, relationship of external variables with UTAUT constructs, and most frequently used external variables.

3.1 Demographic Characteristics

3.1.1 Most Productive Authors

Our analysis of the most prolific authors revealed that 494 authors contributed to the 174 UTAUT studies. Table 1 illustrates the 11 authors who have published three or more papers. These authors published a total of 23 of the 174 research papers, and thus there currently appears to be no dominant group of authors as such. This result is quite different to that obtained by Lee *et al.* (2003) in their study of TAM, where almost 50% of research papers considered were provided by a group of 11 authors. This clearly indicates that studies on UTAUT are not yet dominated by any group of highly productive individuals, publications currently being scattered across a large number of authors each contributing fewer articles.

Table 1
Most Productive Authors

Prolific Authors	University	# of Articles
Gang Liu	Renmin University of China	4
Susan A. Brown	University of Arizona	4
Vishanth Weerakkody	Brunel University	4
Yaobin Lu	Huazhong University of Science and Technology	4
Viswanath Venkatesh	University of Arkansas	4
Bram Pynoo	Ghent University	4
Cheng Qian	Renmin University of China	3
Dehua He	Huazhong University of Science and Technology	3
Dong Cheng	Renmin University of China	3
Paul H.P. Yeow	Multimedia University	3
Shafi Al-Shafi	Brunel University	3

3.1.2 Contributing Universities/Institutions and Authors

Table 2 illustrates 18 universities/institutions associated with the highest combinations of numbers of papers published and associated non-adjusted counts of contributing authors/co-authors. Renmin University in China appears at the top of this list, with five published outputs and a non-adjusted author count of 16. This corresponds with Table 1, which includes three individuals from Renmin University in the list of most productive authors. Ghent University appears in second place, with four publications and a non-adjusted author count of 25, the high author count in this case arising from a single paper with seven authors and three more with six authors each. Surprisingly, U.S Universities (including the University of Arkansas, the University of Nevada, and the University of Georgia) appear relatively low on this list (in comparison with other reviews of research) in terms of the number of papers produced.

Table 2
Publications by University/Institution

University/Institution	# of Papers	Author Count (Non-adjusted)
Renmin University of China	5	16
Ghent University	4	25
Brunel University	4	11
Multimedia University	4	8
Huazhong University of Science and Technology	4	6
National Changhua University of Education	4	5
University of St. Gallen	3	9
University of Cape Town	3	5
University of Macedonia	3	5
National Chung Cheng University	2	7
Korea Advance Institute of Science and Technology	2	6
University of Nevada	2	6
University of North Texas	2	6
University of Arkansas	2	5
University of Twente	2	5
University of Georgia	1	7
Chinese Academy of Sciences	1	6
University of Technology Sydney	1	5

3.1.3 Most Productive Departments

Table 3 illustrates the home departments of the authors or co-authors who have contributed to publishing papers on UTAUT. By far the majority of authors belonged to departments related to the business, management, information systems and technology fields, whereas a far smaller group belonged to departments including journalism and mass communication, and radiology and medical imaging. These departments (Table 3) accounted for 145 of the total of 328 contributing departments.

Table 3
Most Productive Departments

Department/School	#
Department of Information Management / Systems	57
School /college of Business / Management / Business School	55
Department of Radiology / Medical Imaging	15
Faculty of Psychology and Educational Sciences	7

College of Journalism and Mass Communication	7
Department of Telecommunication, Information Studies and Media	4

3.1.4 University Affiliation According to Country

Table 4 presents the 20 countries whose universities contributed the most UTAUT research publications. Of a total of 494 occurrences from 36 distinct countries, and 219 unique universities, the highest proportion of work was produced from universities in the USA (#140, 28%), followed by some way behind by Taiwan (#46), China (#43), the UK (#38), Belgium (#28), Malaysia (#26), and Australia (#21). The low ranking of USA-based universities in Table 2 and their top ranking in Table 4 is explained by the diffusion of UTAUT research across a large number of institutions in the USA, each producing a comparatively low number of publications. Universities in numerous countries contributed three or fewer studies, including Cyprus, Ethiopia, Hong Kong, Peru, Saudi Arabia, and Tanzania, which contributed one study each - these are not listed in Table 4 due to space limitations.

Table 4
University Affiliation According to Country

Researchers' Originating Country	#	Researchers' Originating Country	#
USA	140	Greece	13
Taiwan	46	South Korea	10
China	43	Italy	9
UK	39	South Africa	9
Belgium	28	Canada	7
Malaysia	26	Switzerland	7
Australia	21	Sweden	6
Netherlands	18	Singapore	4
Germany	16	Slovenia	4
Finland	16	Uganda	4

3.1.5 Sources of Primary Data by Country

Our findings (Table 5) reveal that published UTAUT research has been based on primary data captured in 41 countries. By far the most popular source of primary data has been the USA (#45), followed some way behind by China (#19), Taiwan (#17), and then Malaysia (#10), Australia (#8), India (#6), Belgium (#5), and Saudi Arabia (#5). Countries such as Hong Kong, Italy, Peru, Sweden, Tanzania, Thailand, and the UK were used only twice to collect primary data, and a large number of countries - including Austria, Bangladesh, Cyprus, Denmark, Ethiopia, Indonesia, Kuwait, Lithuania, Pakistan, Philippines, Portugal, Romania, Slovenia, South Korea, Sri Lanka, Switzerland, and Uganda - were each used only once to collect such data.

Table 5
Most Used Countries for Primary Data Collection

Country	#	Country	#
USA	45	Germany	4
China	19	Canada	3
Taiwan	17	Greece	3
Malaysia	10	Jordan	3
Australia	8	Netherlands	3
India	6	Qatar	3

Belgium	5	Singapore	3
Saudi Arabia	5	South Africa	3
Finland	5	Total	145

3.1.6 Authors' Academic Backgrounds

In order to examine the academic background of the authors, their associated organisations were divided into three major divisions; academics, public sector, and industry. The findings suggest a summary of the results - unsurprisingly 98% (#484) of authors had an academic background, whereas only four belonged to the public sector, and six were from industry.

3.1.7 Frequency of Publication

This analysis displays the number of publications of UTAUT work appearing between 2004 and June 2011. The findings indicate that the number of publications has generally increased year upon year since the appearance of the original article such as four articles each in 2004 and 2005, nine articles in 2006, 16 articles 2007, 35 articles in 2008, 46 articles in 2009, and the highest 48 articles in 2010, with a significant increase in numbers since 2008 and before a complete trend for the further years was analysed. We suggest that this upward trend will continue and future years will see a further increase in the number of UTAUT-related papers published.

3.1.8 Number of Authors

The findings on the number of authors reveal the frequency of UTAUT research publications being authored and co-authored by between one and seven authors. Two authors created the largest 61 research papers, whereas two papers were published by a group of seven authors. Moreover, 16 articles were single authored, three authors authored 54 articles, four authors authored 28 articles, five authors authored five articles, and six authors authored eight articles.

3.1.9 Publication Outlets for UTAUT Researchers

Table 6 illustrates 20 outlets that have each published two or more UTAUT research papers. Numerous conferences have published UTAUT-research, including the Americas Conference of Information Systems (#6), the European Conference of Information Systems (#5), the IEEE Conference (#4), and the Hawaii International Conference on System Sciences (#4) among others. Similarly, a series of high-ranking internationally recognized journals including Expert Systems with Applications (#3), Government Information Quarterly (#3), Information & Management (#3), and MIS Quarterly (#3) also appear in Table 6, indicating their willingness to accept and publish UTAUT-based research. In addition to the conferences and journals appearing in Table 6, a further 111 outlets each published one paper. This suggest that the publishing landscape for UTAUT researchers is currently quite diverse and widespread, and this is quite unlike the findings of Lee *et al.* (2003) in their study of TAM which found TAM outputs to be concentrated across a relatively small number of journals such as MIS Quarterly, Information & Management, Information Systems Research, and the Journal of Management Information Systems among others.

Table 6

Publishers of UTAUT Research Articles

3.2 IS Research Topics and Types of Systems Examined

3.2.1 Keyword Analysis

Table 7 lists the 30 most frequently used keywords (each occurring three or more times across 174 studies) in UTAUT research. These keywords account for 272 of the overall total of 739 keyword occurrences of the 450 unique keywords identified. As expected, "Unified Theory of Acceptance and Use of Technology"/"UTAUT" (#79) appeared most often, followed by "Technology Acceptance" (#27), "Technology Acceptance Model" (#20), "Adoption" (#13), "Technology Adoption" (#13), "E-Government" (#11), "User Acceptance" (#11), and "Trust" (#9) as some of the other more frequently utilized keywords. In addition, various constructs of UTAUT such as "performance expectancy", "effort expectancy", and "social influence" were also among the keywords appearing three or more times. The regular appearance of certain words and terms such as "acceptance", "adoption", "Internet banking", "end user", "electronic government", "electronic commerce" and "mobile commerce", "structural equation modelling" and "partial least squares" gives the suggestion that many UTAUT studies are focused on investigating the acceptance, adoption, and use of technology in various forms of banking, government services and commerce, and are employing widely utilized analysis methods such as SEM and PLS. However, a large body of keywords (#418) appear once (#369) or twice (#49), and these aspects are worthy of further exploration.

Table 7
Most Frequently Used Keywords (Approach from Dwivedi et al., 2008)

Keywords	#	Keywords	#
Unified Theory of Acceptance and Use of Technology	79	Acceptance	4
Technology Acceptance	27	Performance Expectancy	4
Technology Acceptance Model	20	Saudi Arabia	4
Adoption	13	Structural Equation Modelling	4
Technology Adoption	13	M-Commerce	4

E-Government	11	E-Commerce	3

Trust	9	Effort Expectancy	3
Internet Banking	7	Evaluation	3
E-Learning	6	Gender	3
Intention To Use	6	Information Systems	3
Developing Countries	5	Information Technology	3
Partial Least Squares	5	End User	3
Perceived Risk	5	Mobile Business	3
Social Influence	5	Usability	3

3.2.2 Systems Examined

Over 98 different types of system were examined in the articles under analysis, being classified into the same four categories originally defined by Lee *et al.* (2003) in their review of TAM research: communication systems (25), general-purpose systems (90), office systems (11), and specialized business systems (48). General purpose systems were most frequently examined, and office systems the least. As per the work of Lee *et al.* (2003), general-purpose systems include Windows, personal computers, microcomputers, workstations, the Internet, and other general-purpose computer facilities. Communication systems included mobile-based technology, kiosk systems, automated feedback systems, instant messaging, and other systems primarily used for communications. Mobile technology was the most widely examined technology for communication systems. Office systems include applications that are commonly found in the office environment (such as desktop applications, database and query systems), whereas specialized systems included systems such as e-procurement systems, ERP systems, and e-voting systems. Table 8 presents details of systems included within each category along with the associated publications.

Table 8
Systems Used in UTAUT Studies (Approach from Lee *et al.*, 2003)

Type	# of IS	ISs for Each Category	Associated Publication(s)

3.3 Methodological Analysis

3.3.1 Research Methodology Used

Our findings (see Table 9) revealed that only 18 out of 174 studies were longitudinal in nature, the majority of studies (#135) using a cross-sectional approach. As far as research methodologies were concerned, survey instrument (#155) was most commonly used, followed some way behind by a collection of lesser-used techniques including interview (#12), case study (#4), field study (#3), laboratory experiment (#3), and literature study (#1). Field study (#3) is currently one of the least used methodologies in our research, unlike Lee *et al.*'s (2003) examination of TAM research in which field study was seen to be the most common methodology.

Table 9
Research Methodologies (Approach from Lee et al., 2003)

Methodology	Details	Example Reference(s)
Research Approach	Longitudinal (18)	Brown and Venkatesh (2005), Heerink et al. (2009)

Analysis Tool	SPSS (30)	Jayasingh and Eze (2009), Pynoo et al. (2008)
	AMOS (12)	Schaupp et al. (2010), Shin (2010)
	LISREL (8)	Song and Han (2009), Zhou et al. (2010)
	PLS Graph 3.0 (7)	van Raaij and Schepers (2008), Wu et al. (2010)
	Smart PLS 2.0 (3)	Chan et al. (2010), Laumer et al. (2010)
	Build 1126 (1)	Brown et al. (2010)
	SAS (1)	Tsai et al. (2009)
	SQL (1)	Huser et al. (2010)
Visual Basic 6.0 (1)	van Schaik (2009)	

Survey instruments were commonly used in different forms such as questionnaire survey, telephone survey, and online or Web-based survey. Much data analysis involved structural equation modelling (#45) using software such as AMOS (#12), PLS (#11), and LISREL (#8) or regression analysis (#42) using SPSS (#30). Currently, SPSS is the most commonly used data analysis tool, whereas Lee *et al.*'s (2003) study on TAM revealed the use of LISREL to be predominant.

3.3.2 Research Subjects

Table 10 illustrates that the UTAUT studies can be divided in four broad categories according to user type or alternative source of data, *viz.*: general users, professionals, students, and literature studies. The studies of Brown *et al.* (2010), McLeod *et al.* (2009a), Tibenderana *et al.* (2010), and Zhou *et al.* (2010) used more than one user type for data collection, thus accounting for the total of 178 studies.

Table 10
Research Subjects (Approach from Lee et al., 2003)

User Type	# of Studies	Example Studies
General Users	63	Johnston and Warkentin (2010), Park et al. (2007)
Professionals	74	Pai and Tu (2011), Pynoo et al. (2008)
Students	40	Maldonado et al. (2011), Tsai et al. (2009)
Literature Study	1	He and Lu (2007b)

3.4 Internal Variable Analysis

3.4.1 Relationships between Major UTAUT Variables

UTAUT's six main variables are: Performance Expectancy (PE), Effort Expectancy (EE), Social Influence (SI), Behavioural Intention (BI), and Usage Behaviour (UB), BI being both an independent and dependent variable. A total of 102 of the 174 studies were quantitative in nature and presented quantitative representations of the relationships between constructs. Of these 102 studies, 32 made use of UTAUT more than once in the same study due to different models, user types, or time span implementations resulting in a total of 159 different occurrences of the relationships between corresponding variables. As shown in Table 11, no single study was seen to support all UTAUT relationships (indeed, some studies did not examine all relationships, and yet others examined variations in the original relationships), but all UTAUT relationships are supported by at least one study. The results of this analysis are summarised in Table 11.

3.4.2 Weight Analysis

In order to better understand the predictive power of each individual independent variable, a weight analysis was performed for each independent/dependent variable pairing. We adopted an approach in line with the work of Jeyaraj *et al.* (2006) in order to identify the most/least frequently used predictors, and among these, the best, worst, and promising predictors. Data for this analysis was extracted from Table 11 (and is summarised in Table 12), weights being calculated by the value obtained by dividing the number of times a particular independent/dependent variable relationship was found to be significant by the total number of times that the relationship had been examined across all studies.

Table 12
Relationships between Major UTAUT Variables

Relations	PE-BI	EE-BI	SI-BI	FC-BI	FC-U	BI-U
Significant Relation	93	64	86	32	36	49
Non-Significant Relation	23	46	29	15	18	11
Negative Relation	0	0	0	1	0	1
Not Tested	33	39	34	101	95	88
Total	149	149	149	149	149	149
Total Relations Examined	116	110	115	48	54	61
Total # of Significant Relations	93	64	86	33	36	50
Weight of Predictors	93/116	64/110	86/115	33/48	36/54	50/61
	=0.80	=0.58	=0.75	=0.69	=0.67	=0.82

A weight of '1' indicates that the relationship between the two constructs is significant across all studies, whereas '0' indicates that this relationship is non-significant across all the studies examined. The weights are an indication of the analytical power of an independent variable. However, care must be taken whilst considering these values, as it is not simply a weight of '1' that would declare a variable as being a best predictor. It is also important to note how many times a particular relationship was examined, as consistent evidence across studies is required in order that a best predictor be identified (Jeyaraj *et al.*, 2006).

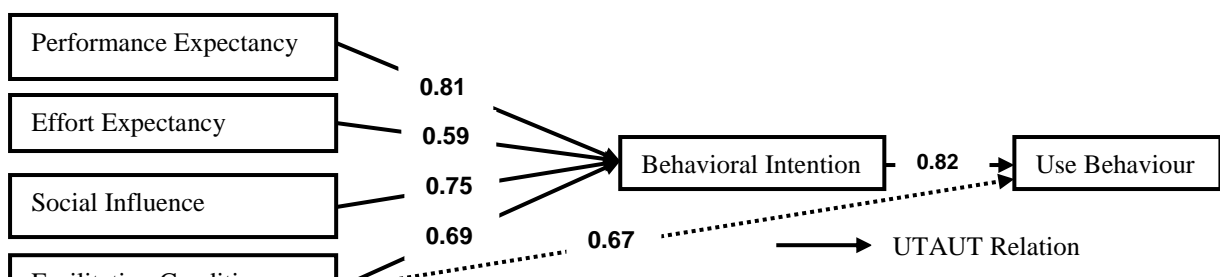

Fig. 2. Weight Significance between UTAUT Constructs (Source: Venkatesh *et al.*, 2003)

This was not particular an issue in our study, as all relationships had been examined numerous times. Jeyaraj *et al.* (2006) suggest that a weight of 0.80 or more is required for an independent variable to qualify as a best predictor, and we adopt this threshold in our work. Figure 2 illustrates the predictive power of the independent variables of UTAUT. Weight analysis of the independent variables indicates that only two variables (PE and BI) qualify for the best predictor category, whereas the other variables did not meet this requirement, the closest being social influence, with a weight of 0.74.

3.5 Analysis of External Variables

3.5.1 Relationship of External Variables Constructs

In the studies we number of being introduced constructs of

work and

Figure 3.

with UTAUT

examined, a external variables onto the major UTAUT. In keeping with the of Lee *et al.* (2003) their work on TAM, we illustrate the mapping of all such external

variables onto the constructs of UTAUT in

Fig. 3. Diagrammatic Representation of External Variables (Approach Adapted from Lee et al., 2003)

3.5.2 Most Frequently Used External Variables

Table 13 presents the 20 most frequently used external variables that affect PE, EE, SI, FC, BI, or UB, and provides the definitions as given in their originating studies. Results reveal that self-efficacy (21 occurrences) is most often used external variable, closely followed by attitude (20 occurrences) and trust (18 occurrences). Comparing these results with those of Lee *et al.* (2003) in their study of TAM reveals that self-efficacy, personal innovativeness, subjective norms, voluntariness, computer anxiety, compatibility, and relative advantage were examined a number of times across both TAM and UTAUT studies.

Table 13

Variables Used in UTAUT Research (Approach from Lee et al., 2003)

EV (#)	Definition	Origin	Referred Articles
SE (21)	The belief that one has the capability to perform a particular behavior	Bandura (1977)	Hutchison and Bekkering (2009), Johnston and Warkentin (2010)
ATT (20)	Person's evaluation of a specified behavior	Fishbein and Ajzen (1975)	Al-Somali et al. (2009), Hutchison and Bekkering (2009)
TRST (18)	Willingness of party to be vulnerable to the actions of the another party based on the expectations that the other party will perform a particular action important to the trustor	Mayers et al. (1995)	Foon and Fah (2011), Sambasivan et al. (2010)
PU (15)	The user's perception to the extent that the system will improve the user's workplace performance--	Davis (1989)	Ambali (2009), Barnes and Vidgen (2009)

PEOU (15)	The extent to which a user believes that using a particular system will be effortless	Davis (1989)	Shin (2010), Udeh (2008)
ANX (12)	An unpleasant emotional state or condition which is characterized by subjective feelings of tension, apprehension, and worry	Spielberger (1972)	AbuShanab et al. (2010), Carlsson et al. (2006)
PR (10)	A combination of uncertainty and plus seriousness of outcome involved	Bauer (1960)	Abu-Shanab and Pearson (2009), Luo et al. (2010)
PI (8)	An individual trait reflecting a willingness to try out any new technology	Agarwal and Karahanna (2000)	Jayasingh and Eze (2009), Xu and Gupta (2009)
STS (7)	The attitude that a user has toward an information system	DeLone and McLean (1992)	Chan et al. (2010), Liu et al. (2008)
TB (7)	The perception that the trustworthiness of the vendor consists of a set of specific beliefs about integrity, benevolence, and competence	McKnight and Chervany (2002)	Luo et al. (2010), Shi (2009)
SN (6)	Person's perception that most people who are important to him think he should or should not perform the behavior in question	Fishbein and Ajzen (1975)	Laumer et al. (2010), Or et al. (2010)
VOL (6)	The degree to which use of the innovation is perceived as being voluntary	Moore and Benbasat (1991)	Anderson et al. (2006), Hutchison and Bekkering (2009)
CAX (5)	An individual's apprehension, or even fear, when she/he is faced with the possibility of using computers	Simonson et al. (1987)	Lin et al. (2004), Nistor et al. (2010)
CSE (5)	An individual judgment of one's capability to use a computer	Compeau and Higgins (1995)	Chiu and Wang (2008), Nov and Ye (2009)
PEN (4)	The extent to which the activity of using a specific system is perceived to be enjoyable in its own right, aside from any performance consequences resulting from system usage	Davis et al. (1992)	Song and Han (2009), Wu et al. (2010)
COMP (3)	The degree to which an innovation is perceived as being consistent with the existing values, needs, and past experiences of potential adopters	Rogers (1983)	Chan et al. (2010), Jayasingh and Eze (2009)
PC (3)	The belief that the promise of another can be relied upon even under unforeseen circumstances	Suh and Han (2002)	YenYuen and Yeow (2009), Yeow and Loo (2009)
RD (2)	The degree to which the results of adopting/using the IS innovation are observable and communicable to others	Rogers (1983)	Keller et al. (2007), Nov and Ye (2009)
RA (2)	The degree to which an innovation is perceived as being better than its precursor	Rogers (1983)	Shin (2010), Udeh (2008)
OB (2)	A systematic error in perception of an individual's own standing relative to group averages, in which negative events are seen as less likely to occur to the individual than average compared with the group, and positive events as more likely to occur than average compared with the group	Weinstein (1980)	Carter and Schaupp (2009), Schaupp et al. (2010)

3.6 Major Limitations of UTAUT Studies

An analysis of acknowledged limitations across studies indicated that focusing on a single subject - in terms of a community, culture, country, organisation, agency, department, person, or age group - was the most widespread reported constraint (35 studies). This was followed by 27 studies acknowledging their focus on a single task at a given point of time, and hence according to Lee *et al.* (2003), limiting the potential of generalization of findings - a key weakness. In Lee *et al.*'s (2003) work on TAM, self-reported usage was the weakness most often acknowledged, whereas in our study, it appeared in seventh place in our list of acknowledged limitations. A series of additional limitations (including limited sample size, use of students to explore workplace issues, no use of moderating variables, and lack of exogenous factors) were also reported in the literature. Details of these and others are presented in Table 14, along with associated references. Nine limitations were reported only in a single study - these are documented in Table 14 in the *other limitations* category.

Table 14

Limitations in UTAUT Studies (Approach from Lee *et al.*, 2003)

Limitation	#	Explanation	Studies
Single Subject/ Biased Sample	35	Sample based on only one or limited community, culture, country, organisation, agency, department, person, or age-group	Aggelidis and Chatzoglou (2009), Brown and Venkatesh (2005), Brown <i>et al.</i> (2010), Chang <i>et al.</i> (2007), Chiu <i>et al.</i> (2010), Dasgupta and Gupta (2010), He and Lu (2007a), Ho and Chou (2009), Hung <i>et al.</i> (2007), Jayasingh and Eze (2009), Koh <i>et al.</i> (2010), Koivumaki <i>et al.</i> (2008), Laumer <i>et al.</i> (2010), Lee <i>et al.</i> (2010a), Li (2010), Mahzan and Lymer (2008), Maldonado <i>et al.</i> (2009), Maldonado <i>et al.</i> (2011), Niehaves and Plattfaut (2010), Or <i>et al.</i> (2011), Pai and Tu (2011), Sahu and Gupta (2007), Samoutis <i>et al.</i> (2008), Schaper and Pervan (2006), Shin (2009), Tibenderana <i>et al.</i> (2010), Tsai <i>et al.</i> (2009), Wang and Shih (2009), Wang <i>et al.</i> (2009), Wu <i>et al.</i> (2007), YenYuen and Yeow (2009), Yeow and Loo (2009), Yeow <i>et al.</i> (2008), Yao and Murphy (2007), Zhou <i>et al.</i> (2010)
Single Task	27	Difficult to generalize the result	Abu-Shanab and Pearson (2009), Aggelidis and Chatzoglou (2009), Alapetite <i>et al.</i> (2009), AlAwadhi and Morris (2011), Brown and Venkatesh (2005), Carter and Schaupp (2009), Chang <i>et al.</i> (2007), Chiu and Wang (2008), Hung <i>et al.</i> (2007), Huser <i>et al.</i> (2010), Kijisanayotin <i>et al.</i> (2009), Mahzan and Lymer (2008), Maldonado <i>et al.</i> (2009), Maldonado <i>et al.</i> (2011), Mayer <i>et al.</i> (2011), Schaper and Pervan (2006), Shin (2009), Shin (2010), Sumak <i>et al.</i> (2010), Teo (2011), Terzis and Economides (2011), Tsai <i>et al.</i> (2009), van Raaij and Schepers (2008), Wang and Shih (2009), Xu and Gupta (2009), Yao and Murphy (2007), Zhou <i>et al.</i> (2010)
Cross Sectional Study	17	One time cross-sectional study	Al-Gahtani <i>et al.</i> (2007), Aoun <i>et al.</i> (2010), Chiu <i>et al.</i> (2010), Chiu and Wang (2008), Heikkila and Smale (2010), Hung <i>et al.</i> (2007), Kijisanayotin <i>et al.</i> (2009), Luo <i>et al.</i> (2010), Neufeld <i>et al.</i> (2007), Sambasivan <i>et al.</i> (2010), Schaupp <i>et al.</i> (2010), Shin (2010), Tibenderana <i>et al.</i> (2010), Wang <i>et al.</i> (2009), Wills <i>et al.</i> (2008), Wu <i>et al.</i> (2007), Zhou <i>et al.</i> (2010)

Limited Sample Size	14	Small sample size	Aggelidis and Chatzoglou (2009), Chiu and Eysenbach (2010), Duyck et al. (2008), Foon and Fah (2011), Hutchison and Bekkering (2009), Lee et al. (2010a), Maldonado et al. (2009), Marchewka et al. (2007), McLeod et al. (2009a), Pynoo et al. (2011), Or et al. (2011), Trimmer et al. (2008), van Raaij and Schepers (2008), Wills et al. (2008)
Single IS	12	Only a Single IS for the research	Aggelidis and Chatzoglou (2009), Aoun et al. (2010), Brown et al. (2010), Carlsson et al. (2006), Chang et al. (2007), Chiu and Wang (2008), Gupta et al. (2008), Im et al. (2008), Sambasivan et al. (2010), Wang and Shih (2009), Wang et al. (2009), Zhou et al. (2010)
Limited external factors or variables	11	Counted number of external constructs	Chan et al. (2010), Chiu and Eysenbach (2010), Gupta et al. (2008), He and Lu (2008), He et al. (2007), Im et al. (2008), Or et al. (2011), Schaupp et al. (2010), Terzis and Economides (2011), van Schaik (2009), Wu et al. (2007)
Self-reported Usage	11	Did not measure the actual usage	Abu-Shanab and Pearson (2007), Abu-Shanab and Pearson (2009), de Silva and Ratnadiwakara (2009), Hung et al. (2007), Jayasingh and Eze (2009), Lin et al. (2004), Luo et al. (2010), van Schaik (2009), Venkatesh et al. (2008), Wang et al. (2009), Zhang et al. (2010)
Student Sample	11	Improper to reflect the real working environment	AlAwadhi and Morris (2011), Carter and Schaupp (2009), Im et al. (2008), Johnston and Warkentin (2010), Luo et al. (2010), McLeod et al. (2009a), McLeod et al. (2009b), Sumak et al. (2010), Tsai et al. (2009), Wu et al. (2010), Zhang et al. (2010)
Self-reported/selection Bias	7	Poll suffering from self-selecting opinion	Carter and Schaupp (2009), Chan et al. (2010), Chiu et al. (2010), Chiu and Wang (2008), Sahu and Gupta (2007), Schaupp et al. (2010), Teo (2011)
No moderating variables	6	No moderating variables used	Al-Sobhi et al. (2011), Chen et al. (2008), Huser et al. (2010), Loo et al. (2009), Yeow and Loo (2009), YenYuen and Yeow (2009)
Explanatory Study/ Incomplete research	4	Partially complete research	Barati and Mohammadi (2009), Debusse et al. (2008), Koivumaki et al. (2008), YenYuen and Yeow (2009)
Limited exposure to the technology	3	Target population least aware to technology	Huser et al. (2010), Hutchison and Bekkering (2009), Shin (2009)
Common method bias/variance	3	Data collected using same survey	Laumer et al. (2010), Tsai et al. (2009), Wang et al. (2009)
Gender Bias - Majority female/male	2	Majority of either male or female	Sumak et al. (2010), Wills et al. (2008)
Male sample	2	Only male respondents	Al-Sobhi et al. (2011), Dasgupta and Gupta (2010)
Low R-Square/ Unexplained σ^2	2	Variance not explained	Hung et al. (2007), Teo (2011)
Other Limitations	9	(1) Cultural factors not analyzed (2) Lack a measure of acceptance (3) Limited applications (4) Difficulty to measure BI, (5) Original variance not explored, (6) Low response rate, (7) Use of partial constructs of UTAUT, (8) Disproportionate sample, and (9) Respondents already	(1) de Silva and Ratnadiwakara (2009), (2) Duyck et al. (2010), (3) Loo et al. (2009), (4) Neufeld et al. (2007), (5) Pai and Tu (2011), (6) Pynoo et al. (2011), (7) Shamsuddin (2009), (8) Shin (2009), and (9) Sumak et al. (2010)

3.7 Theoretical and Methodological Details

Table 15 (see Appendix A) presents an overview of the type of system/software/application established, the size and user type forming the sample, and the model tested (in addition to the UTAUT) in each study. It can be seen that TAM (with 29 occurrences) is the most commonly applied model in conjunction with UTAUT, which is followed some way behind by TPB (6 occurrence), TAM2 and the DeLone and McLean IS Success Model (5 occurrences each), IDT and TTF (3 occurrences each), and one occurrence each for TRA, SCT, Trust Model, Andersen’s Behavioural Model, and the Theory of Cultural Dimension. It is apparent from Table 15 that the majority of studies used an appropriate sample size, although some employed small samples with fewer than 50 participants (for example, BenMessaoud *et al.*, 2011; Biemans *et al.*, 2005; Lee *et al.*, 2010b, and Samoutis *et al.*, 2008). Some authors (including Chiu and Eysenbach, 2010; Duyck *et al.*, 2008; Hutchison and Bekkering, 2009; Pynoo *et al.*, 2011; van Raaij and Schepers, 2008) acknowledged a small sample size as being one of their limitations, whereas others (including Foon and Fah, 2011; Lee *et al.*, 2010a), in addition to this acknowledgement, also recognized that their limited sample size could hamper generalization of the overall results of their studies. It is worth noting that some studies (Bandyopadhyay and Bandyopadhyay, 2010; Duyck *et al.*, 2010; McLeod *et al.*, 2009a; Pynoo *et al.*, 2008; Pynoo *et al.*, 2011; Yao and Murphy, 2007) utilized more than one sample to test their models, the rationale in some cases (Duyck *et al.*, 2010; Pynoo *et al.*, 2008; Pynoo *et al.*, 2011) being the longitudinal nature of the investigation.

4. Discussion

Our intention in this paper was to present the results of a systematic and comprehensive review of the development of UTAUT since its inception in 2003. Based on a review of 174 papers identified from various sources such as Thompson Scientific *Web of Science* database and *Google Scholar*, results were presented in terms of six major aspects: demographic characteristics, research topics and types of technology examined, methodological analysis, internal and external variable analysis, analysis of major limitations, and theoretical and methodological details.

Our analysis of the most prolific authors illustrates that the 11 most productive individuals (e.g., Brown *et al.*, 2010; Liu *et al.*, 2008; Weerakkody *et al.*, 2009) in terms of UTAUT-based publications contributed to 13% of the total number of articles, which is around a quarter of the volume produced by the same number of the most productive authors (see Lee

et al., 2003; Legris et al., 2003) publishing TAM related research. This indicates that the field currently remains diversified in terms of the number of authors contributing to the UTAUT related articles, with no prominent group of individuals dominating. A similar picture emerges from our analysis of outlets publishing UTAUT research, the field currently being highly diversified with no "obvious" journal or set of journals being the natural home for UTAUT work. This contrasts with the situation pertaining to TAM research, where a number of key journals (including *MIS Quarterly* and *Information & Management*) have attracted a substantial amount of content. The natural and obvious reason for this would be the greater level of maturity of TAM compared to UTAUT, however, some nine years after the appearance of the original UTAUT article by Venkatesh *et al.* (2003), and despite a fast growing and substantial number of citations, the number of studies published in comparable journals actually making use of UTAUT remains relatively low.

Our country analysis indicates that research in the 174 publications considered was conducted in 41 countries via the activities of researchers affiliated to universities in 36 different countries. The USA was the leading country both in terms of location for research and number of research affiliations. It was noticeable that in a number of cases, numerous authors were affiliated with universities in a particular country, but little primary data has actually been collected in that country - for instance, 38 researchers were affiliated with universities in the UK, yet only two studies were based on primary data collected in the UK. Given the current dominance of the USA as the principal location for collecting primary data (and the limited work conducted elsewhere), there is clearly ample opportunity for researchers to conduct original work by collecting data in additional countries.

Given our analysis examined 174 articles, it was noticeable that there was no leading institution or group of institutions in terms of the number of articles published, with Renmin University in China being the leading institution in terms of number of papers produced (#5). Despite the USA being by far the preferred location for collecting primary data, and USA-based researchers dominating in terms of the number of articles actually produced, only four USA-based institutions appear in the list of the top 18 universities in terms of number of articles produced, the universities of Nevada and North Texas being placed equal 12th. This indicates that the large amount of UTAUT-related research effort in the USA is spread throughout a large number of contributing institutions, rather than any small number being seen to specialize in such work.

A similar line of enquiry for the most prolific authors also suggests that there is no monopoly of any group of authors in publishing research on UTAUT. Six authors, including Venkatesh, jointly hold the leading position with four articles each, followed by five authors with three articles each. A further 39 authors contributed two articles each, and by far the largest group of 377 authors contributed to just one article each, indicating again that research using UTAUT has been diversified over the years, and no researchers appear to have yet made it their primary area of focus.

Analysis of the most productive departments reveals that most UTAUT work has been carried out by researchers based in departments related to the business, management, information systems and technology fields. This is as might be expected, and we suggest that extended use of UTAUT in additional and diverse fields of study (we have currently seen some limited use in journalism, psychology, education and medicine) is likely to augment the

level of understanding of the value of the theory, along with contributing to the identification of further strengths and weaknesses.

Our analysis in terms of publication statistics demonstrates that the number of UTAUT-related publications appearing has generally increased year upon year since the appearance of the original article, with a significant increase in numbers since 2008. Our results show fewer articles appearing in 2011 due to the timing of our data collection activities, but we anticipate that the upward trend will continue, albeit in relatively modest terms.

Results of our keyword analysis suggest that the model has been primarily used for technology adoption and acceptance research in the areas of e-government, e-banking, e-learning and e-commerce. In terms of the eight contributing theories and models, TAM has been most often discussed alongside UTAUT. Our findings reveal that office systems have attracted little investigative attention from researchers making use of UTAUT, which is in direct contrast to the findings of Lee *et al.* (2003) in their study of TAM, in which the study of office systems accounted for 27% of cases. This situation is essentially a comment on the evolution of systems that are of interest to researchers - clearly in the period covered by Lee *et al.* (2003), office systems were deemed worthy of investigation, whereas they are now commonplace, and not viewed as being a particularly new technology in the organisational environment. The relatively recent widespread introduction and use of customer-facing technology in domains such as government, retailing, and education has seen a range of new opportunities for original research emerge and continue to materialize, and there is still ample opportunity for researchers to conduct innovative work.

In terms of the methodological aspects of UTAUT research, our investigation revealed a very similar set of results to those of Lee *et al.* (2003) in that despite the acknowledged value of longitudinal studies in investigating users' changing attitudes toward technology over time as they become familiarized (Doll and Ahmed, 1983), only a minority of studies have been longitudinal in nature, with by far the majority of studies making use of a cross-sectional approach. This may be a result of the relatively recent emergence of UTAUT, but when combined with the dominance of the survey approach, it can be seen that there remains ample scope for original research beyond the current cross-sectional/survey dominance by making use of alternative methodological contexts, tools and techniques. According to Lee *et al.* (2003) in their study of TAM research, field study and lab experiment were the most common approaches, whereas in our examination of UTAUT research, they appear to have been little used thus far.

PLS and regression analysis have been commonly used in both TAM and UTAUT-based studies, and while other techniques such as SEM, CFA, and FA have been frequently employed to date in UTAUT research, they have been used to a far lesser extent in the TAM context. This may be a reflection on the gradual evolution of methodological preferences, or may be accounted for by other reasons - hence this aspect and other methodological issues would appear to be worthy of further investigation. In terms of software tools used to support analysis during UTAUT investigations, SPSS currently appears to be most favoured, while AMOS, LISREL, and PLS Graph have also been used on a number of occasions. This overall situation is again in contrast to the findings of Lee *et al.* (2003) in which analysis in TAM studies was generally carried out using LISREL.

A reasonably large (22.5%) contribution of data collected during the UTAUT research considered in our study came from students, and while it is acknowledged that such data samples may not always be representative of the situation in the “real world” (Dwivedi *et al.*, 2008), it does reflect that the approach remains a relatively convenient way for academic researchers to capture data.

Of the 102 quantitative studies using theories and theoretical constructs, 32 made use of more than one model in the same study to differentiate between aspects of research in terms of models, user types, and sector types. This use of multiple models within a single study expands the number of results we are able to consider in our investigation from 102 to 159, and hence increased the amount of input into our analysis of the overall performance of the theory and its constituent relationships. Results from our corresponding weight analysis between sets of relationships indicated that only PE and BI met the requirements of Jeyaraj *et al.* (2006) to be classed as best predictors of BI and Use Behavior respectively. Hence, there is still a need for further work in this respect in order to examine the role played by other variables, and their potential to qualify for the best predictor category.

From our diagrammatic representation of the diverse range of external variables examined by various studies (see Figure 3), it can be seen that the largest group of variables was examined in terms of their influence on the behavioral intention construct. This is entirely as would be expected given the intention of UTAUT to assist with the measurement of the intention to adopt a new technology. Our analysis of the most frequently external constructs indicated that aspects viewed by Venkatesh *et al.* (2003) as being accounted for and measured as part of the original UTAUT model often also appear as external variables in published UTAUT-related research - in essence, such cases see the variables concerned as being measured to a greater extent than anticipated. Our results in this respect mirror to an extent those of Lee *et al.* (2003) in their study of TAM research that also identified certain external variables being accounted for to a greater or lesser extent by TAM itself.

Limitations acknowledged by the studies included in our investigation appear to center on data collection issues - such as focusing on single subject or single task, conducting investigations that are cross sectional in nature and those which are limited in sample size. Self-reporting of actual use was also an issue, but not to the same extent as reported by Lee *et al.* (2003) in their study of TAM research, which identified self-reporting of system use as the main weakness. There would therefore appear to be much scope for researchers to conduct original work that addresses these reported limitations.

5. Conclusion, Limitations, and Future Work

Our intention in this paper is to present an overview of the current state of UTAUT-related research by presenting the results of a systematic and comprehensive review of 174 articles appearing since 2004. Results were presented in terms of six major aspects: demographic characteristics, research topics and types of technology examined, methodological analysis, internal and external variable analysis, analysis of major limitations, and theoretical and methodological details. Our intent in conducting the investigation was to provide a useful and usable resource for future researchers by providing information on the key areas previously addressed in UTAUT research, how UTAUT research tends to be carried out, and what is usually studied during the course of UTAUT research.

In keeping with previous 'state of play' studies of this nature, we posit that our findings highlight promising lines of inquiry as well as those that are neglected and those that have already received much attention. All three aspects of analysis in our study imply that UTAUT research is still in its relatively early stages of development, with no clear areas of maturity, but appears to be developing quickly. UTAUT has evolved and been tested and augmented by researchers making use of existing models in conjunction with UTAUT, and by introducing variables and exploring alternative relationships between its constituent components in various contexts and environments, but there are still ample and clear opportunities for researchers to engage with and further shape and develop the field.

Our results reveal that there are many journals and conferences publishing UTAUT research, with contributors from many regions although the majority is unsurprisingly from the USA. There are therefore many opportunities for researchers from other regions to embark on original studies of culture and context-related UTAUT research. The acknowledged limitations of published work provide an initial point from which to identify areas suitable for further research - overly focused subjects and tasks, limited sample sizes in some studies, and a lack of longitudinal work all provide indicators to further opportunities for researchers. Self-reported usage, use of student samples, and a lack of consideration of moderating variables also suggest areas where additional work can be viewed as being necessary. Finally, the results of our weight analysis suggest that the cumulative predictive power of each individual independent variable was not consistent or at the level expected, with only two variables (performance expectancy and behavioural intention) meeting the benchmark of Jeyaraj *et al.* (2006) and qualifying for best predictor category. Further investigation into the performance of the relationships within the model would therefore appear to be appropriate.

We anticipate this paper will prove to be a useful source of information for those readers who wish to learn more about the various facets pertaining to published UTAUT research, and suggest that the findings of this study may help in directing limited and valuable research resources to potentially fruitful lines of inquiry as well as strengthening the overall field of UTAUT research by facilitating consideration of useful alternative theoretical and methodological perspectives, and by highlighting aspects requiring further scrutiny. However, we acknowledge that our study has a number of limitations and readers should interpret the material presented in this paper within the context of these limitations.

Perhaps the most obvious limitation is that of literature forming our sample - as with all articles of this type, our results reflect the material actually examined, and clearly there may be significant and influential work that we have not included. For instance, our search activities were centered on occurrences of keywords in order to avoid locating large numbers of publications where these keywords might have been used as casual words in the main text. We fully acknowledge that there may be numerous studies, which lack keywords in the title, but still focus upon UTAUT in some form. We admit this aspect and encourage further research to extend the amount of material considered. However, we posit that our sampling approach was sufficient to provide a representative reflection of the current state of UTAUT research.

Appendix A.

Table 16

Methodological Details (Approach from Legris *et al.*, 2003)

Study	System/Software/Application Type	Sample Size
AbuShanab and Pearson (2007)	Internet Banking	523 non-Internet banking customers
Abu-Shanab and Pearson (2009)	Internet Banking	878 bank customers
AbuShanab <i>et al.</i> (2010)	Internet Banking	523 non-Internet banking customers
Aggelidis and Chatzoglou (2009)	Hospital Information System	283 employees
Alapetite <i>et al.</i> (2009)	Speech Recognition System	39 physicians
AlAwadhi and Morris (2011)	E-Government Services	880 students
Al-Gahtani <i>et al.</i> (2007)	Information Technology	722 knowledge workers
Al-Harby <i>et al.</i> (2010)	Biometrics Authentication System	306 under/post-graduate students
Al-Rajhi <i>et al.</i> (2010)	Information System	<i>Study not validated yet</i>
Al-Shafi and Weerakkody (2009)	E-Government Services	216 citizens
Al-Shafi and Weerakkody (2010)	E-Government Services	1179 citizens
Al-Sobhi <i>et al.</i> (2011)	E-Government Services	750 citizens
Al-Somali <i>et al.</i> (2009)	Online Banking	202 bank customers
Ambali (2009)	E-Filing System	300 taxpayers
Anderson <i>et al.</i> (2006)	Tablet PCs	37 faculty members
Aoun <i>et al.</i> (2010)	Accounting Information System	192 accounting practitioners
Avdic and Eklund (2010)	Reference Databases	150 students
Bandyopadhyay and Bandyopadhyay (2010)	Information Technology	762, 502 professionals
Barati and Mohammadi (2009)	Mobile Banking	<i>Exploratory Study- data to be collected</i>
Barnes and Vidgen (2009)	Corporate Intranet	131 sales and marketing professionals
BenMessaoud <i>et al.</i> (2011)	Robotic-Assisted Surgery	21 surgeons
Benslimane <i>et al.</i> (2004)	Web Systems for e-Procurement	136 corporate buyers
Biemans <i>et al.</i> (2005)	Medical Teleconferencing Application	18 nurses
Brown and Venkatesh (2005)	Information Technology	746 households
Brown <i>et al.</i> (2010)	Collaboration Technology	349 SMS users
Butler and Richardson (2008)	iBrainz Technology	47 students
Cabral <i>et al.</i> (2009)	Water Treatment Technology	<i>No data value collected yet</i>
Carlsson <i>et al.</i> (2006)	Mobile Devices/Services	157 subjects
Carter and Schaupp (2009)	E-File	260 students
Chan <i>et al.</i> (2010)	E-Government Technology	1179 citizens
Chang <i>et al.</i> (2007)	Clinical Decision Support System	140 physicians
Chen <i>et al.</i> (2008)	Weblog System	153 students
Cheng <i>et al.</i> (2008a)	Internet Banking	413 professionals

Cheng <i>et al.</i> (2008b)	Internet Banking	313 professionals
Cheng <i>et al.</i> (2008c)	Internet Banking	313 professionals
Chisolm <i>et al.</i> (2010)	Electronic Medical Record	71 clinicians
Chiu and Eysenbach (2010)	E-Health Services	46 professionals
Chiu and Wang (2008)	Web-Based Learning	286 respondents
Chiu <i>et al.</i> (2010)	Online Auctions	412 buyers
Cody-Allen and Kishore (2006)	E-Quality	<i>Data collection to be done in the future</i>
Cornacchia <i>et al.</i> (2008)	ICT	40 employees
Coss (2009)	Medical Support System	<i>Data collection to be done in the future</i>
Curtis and Payne (2008)	Computer-Assisted Audit Techniques	139 professionals
Curtis <i>et al.</i> (2010)	Social Media	409 professionals
Dada (2006)	E-Readiness	328 people from Tanzania+78 from SA
Dadayan and Ferro (2005)	Technology	<i>Data collection will be done latter</i>
Dasgupta and Gupta (2010)	Internet Technology	102 government employees
de Silva and Ratnadiwakara (2009)	Mobile Technology	9540 telephone users
Debusse <i>et al.</i> (2008)	Automated Feedback System	8 academic staff
Diaz and Loraas (2010)	Existing Technology	69 students
Dulle and Minishi-Majanja (2011)	Open Access	544 teachers
Duyck <i>et al.</i> (2008)	PACS System	56 professionals
Duyck <i>et al.</i> (2010)	PACS System	203, 159, 362 Physicians-Radiologists
Fitterer <i>et al.</i> (2010)	Health Information System	79 professionals
Foon and Fah (2011)	Internet Technology	200 professionals
Gunther <i>et al.</i> (2009)	Micro Blogging	25 Twitter Users
Gupta <i>et al.</i> (2008)	ICT	102 employees
Hailemariam <i>et al.</i> (2010)	Telemedicine	Physicians and health workers
He and Lu (2007a)	Mobile Advertising	243 mobile consumers
He and Lu (2007b)	Mobile Business	74 journal articles
He and Wei (2009)	Knowledge Management System	161 professionals
Heerink <i>et al.</i> (2009)	Interface Robot	42 elderly citizens
Heikkila and Smale (2010)	Electronic HRM System	18 HR managers
Hennington <i>et al.</i> (2009)	Electronic Medical Record System	23 Nurses and 4 Nurse Managers
Ho and Chou (2009)	Mobile Podcasting	246 citizens
Huang and Wang (2009)	ERP System	236 professionals
Huang <i>et al.</i> (2010)	Information Technology	Healthcare professionals from 10 firms
Hung <i>et al.</i> (2007)	E-Government Services	244 citizens
Huser <i>et al.</i> (2010)	EHR Query System	18 human subjects
Hutchison and Bekkering (2009)	Remote Desktop Application	25 students

Im <i>et al.</i> (2008)	Technologies for Communication	161 subjects
Jalaldeen <i>et al.</i> (2009)	Knowledge Management Process	<i>Conceptual model - to be used latter</i>
Jayasingh and Eze (2009)	M-Coupon System	781 mobile consumers
Johari <i>et al.</i> (2010)	Information Kiosk	<i>Data collection to be done in the future</i>
Johnston and Warkentin (2010)	Security Information System	275 subjects
Jong and Wang (2009)	Web-based Learning System	606 students
Keller <i>et al.</i> (2007)	E-Learning System	67 students
Kijsanayotin <i>et al.</i> (2009)	Health Information Technology	1187 community health centres
Koh <i>et al.</i> (2010)	Software Technologies	333 employees
Koivumaki <i>et al.</i> (2008)	Mobile Services	243 mobile consumers
Kourouthanassis <i>et al.</i> (2010)	Mobile Internet Application	139 subscribers
Laumer <i>et al.</i> (2010)	Information Technology	323 students
Lee and Lin (2008)	Podcasting	190 students
Lee <i>et al.</i> (2007)	Forecasting Support System	54 students
Lee <i>et al.</i> (2010a)	Activity Based Management System	112 professionals
Lee <i>et al.</i> (2010b)	DEMATEL	10 professionals
Li (2010)	Virtual Knowledge Sharing	41 employees
Li and Kishore (2006)	Online Community Weblog System	265 students
Lin <i>et al.</i> (2004)	Instant Messaging	300 students
Liu <i>et al.</i> (2008)	Internet banking	413 professionals
Loo <i>et al.</i> (2009)	Smartcard Application	200 MyKad holders
Louho <i>et al.</i> (2006)	Hybrid Media Application	19 test users
Lubrin <i>et al.</i> (2006)	Motes	103 anonymous participants
Luo <i>et al.</i> (2010)	Mobile Banking	122 students
Mahzan and Lymer (2008)	CAATs	46 members of IIA-UK
Maldonado <i>et al.</i> (2009)	Educational Portal	150 students
Maldonado <i>et al.</i> (2011)	Educational Portal	150 students
Marchewka <i>et al.</i> (2007)	Course Management Software	132 students
Mayer <i>et al.</i> (2011)	Smart Products	166 citizens
McLeod <i>et al.</i> (2009a)	Tax Software System	74 professionals and 56 novices
McLeod <i>et al.</i> (2009b)	Tax Preparation Software	215 students
Neufeld <i>et al.</i> (2007)	Information Technology	209 professionals
Niehaves and Plattfaut (2010)	Internet	192 elderly citizens
Nistor <i>et al.</i> (2010)	E-Learning System	732 students
Nov and Ye (2009)	Digital Library	271 students
Or <i>et al.</i> (2011)	Web-Based Technology	101 patients
Oshlyansky <i>et al.</i> (2007)	Validating UTAUT tool	1489 students from nine countries

Pahlke and Beck (2009)	Enterprise Mashup System	<i>Constructs to be operationalized latter</i>
Pahnla <i>et al.</i> (2011)	Auction Site	180 students
Pai and Tu (2011)	CRM Systems	271 professionals
Pappas and Volk (2007)	Audience Counts & Reporting System	27 independent education organizations
Park <i>et al.</i> (2007)	Mobile Technology	221 citizens
Pavon and Brown (2010)	World Wide Web	228 job seekers
Payne (2008)	Web 2.0	338 members of public relations society
Pynoo <i>et al.</i> (2008)	PACS System	600, 180 physicians
Pynoo <i>et al.</i> (2011)	Digital Learning Environment	64, 41, 55 teachers
Qingfei <i>et al.</i> (2008)	Mobile Commerce	<i>Data collection and analysis to be done</i>
Randeree (2009)	Personal Health Record System	128 students
Reunis and Santema (2005)	E-Ordering Application	25 professionals
Richardson <i>et al.</i> (2009)	Problem Solving Models	33 students
Sahu and Gupta (2007)	E-Government	163 users of Indian central excise
Sambasivan <i>et al.</i> (2010)	Electronic Procurement System	358 users from various ministries
Samoutis <i>et al.</i> (2008)	Quality Improvement Intervention	18 patients
Sapio <i>et al.</i> (2010)	Digital Television	181 citizens
Schaper and Pervan (2004)	ICT	6500 professionals
Schaper and Pervan (2006)	Technologies	2870 professionals
Schaupp <i>et al.</i> (2010)	E-File	260 taxpayers
Seymour <i>et al.</i> (2007)	Enterprise Resource Planning Systems	59 students
Shamsuddin (2009)	Computer Graphics Technology	46 students
Sharma and Citurs (2004)	Information Technology	<i>Proposed model would be tested latter</i>
Shi (2009)	Smart Phone Application Software	653 professionals
Shin (2009)	Mobile Wallet	296 professionals
Shin (2010)	MVNO Services	296 members of community
Song and Han (2009)	Mobile System	570 consumers
Suhendra <i>et al.</i> (2009)	Information Technology	150 SME operators
Suki and Ramayah (2010)	E-Government Services	200 respondents
Sumak <i>et al.</i> (2010)	Virtual Learning Environment	235 students
Taksa and Flomenbaum (2009)	Cross-Cultural Information Retrieval	20 Websites
Tan and Wu (2010)	Mobile Commerce	300 students
Tavares and Amarel (2010)	Peer-to-Peer Academic Networks	10 interviews from users and non-users
Teo (2011)	Intention to Use Technology	592 teachers
Terzis and Economides (2011)	Computer Based Assessment Model	173 students
Tibenderana <i>et al.</i> (2010)	Hybrid Library Services	445 staff and students
Trimmer <i>et al.</i> (2008)	Electronic Medical Record Systems	<i>Data collection in process</i>

Tsai <i>et al.</i> (2009)	Learning Behaviour Formation	759 students
Udeh (2008)	Wi-Fi System	129 respondents
Uzoka (2008)	E-Commerce	150 organizations
van Biljon and Kotze (2008)	Mobile Phone	59 students
van Biljon and Renaud (2008)	Mobile Phone	34 elderly citizens
van Dijk <i>et al.</i> (2008)	Government Internet Services	1225 respondents
van Raaij and Schepers (2008)	Virtual Learning Environment	45 students
van Schaik (2009)	Websites	118, 121 students
van Setten <i>et al.</i> (2006)	Recommender System	1872 television viewers
Venkatesh <i>et al.</i> (2008)	New System Use	321 employees
Verhoeven <i>et al.</i> (2010)	ICT	714 students
Wang and Shih (2009)	Information Kiosks	244 respondents
Wang <i>et al.</i> (2009)	Mobile Learning	330 Respondents with IT experience
Wang <i>et al.</i> (2010)	Mobile Internet	343 respondents
Weerakkody <i>et al.</i> (2009)	E-Government	1179 citizens
Whitten <i>et al.</i> (2009)	Telehospice	25 employees
Wills <i>et al.</i> (2008)	Electronic Medical Record	52 professionals
Wu <i>et al.</i> (2007)	3G Mobile Communication	394 professionals
Wu <i>et al.</i> (2008)	3G Mobile Telecommunication	394 professionals
Wu <i>et al.</i> (2010)	Educational Technology System	240 students
Xu and Gupta (2009)	Location-Based Services	101 students
Yang (2010)	Mobile Shopping Services	400 mobile consumers
Yang <i>et al.</i> (2008)	Software Cost Estimation	116 organizations
Yao and Murphy (2007)	Remote Electronic Voting Systems	453, 253, 196 voters
YenYuen and Yeow (2009)	Internet Banking	280 general users
Yeow and Loo (2009)	ATM and Transit Application	500 MyKad holders
Yeow <i>et al.</i> (2008)	Online Banking Service	190 respondents
Zhang <i>et al.</i> (2010)	Mobile Search Service	195 students
Zhou (2008)	Mobile Commerce	250 mobile commerce users
Zhou <i>et al.</i> (2010)	Mobile Banking	250 students and professionals
